

# **Tracing microcalcification development in the porcine pancreatic elastase murine model of abdominal aortic aneurysm using $\text{Na}[^{18}\text{F}]\text{F}$**

7<sup>th</sup> International Meeting on Aortic Diseases

Michael Bell MSc  
Email: [ummbe@leeds.ac.uk](mailto:ummbe@leeds.ac.uk)

- Detection of **microcalcifications** predicted aneurysm **growth** and risk of **rupture** (SoFIA<sup>3</sup> trial)

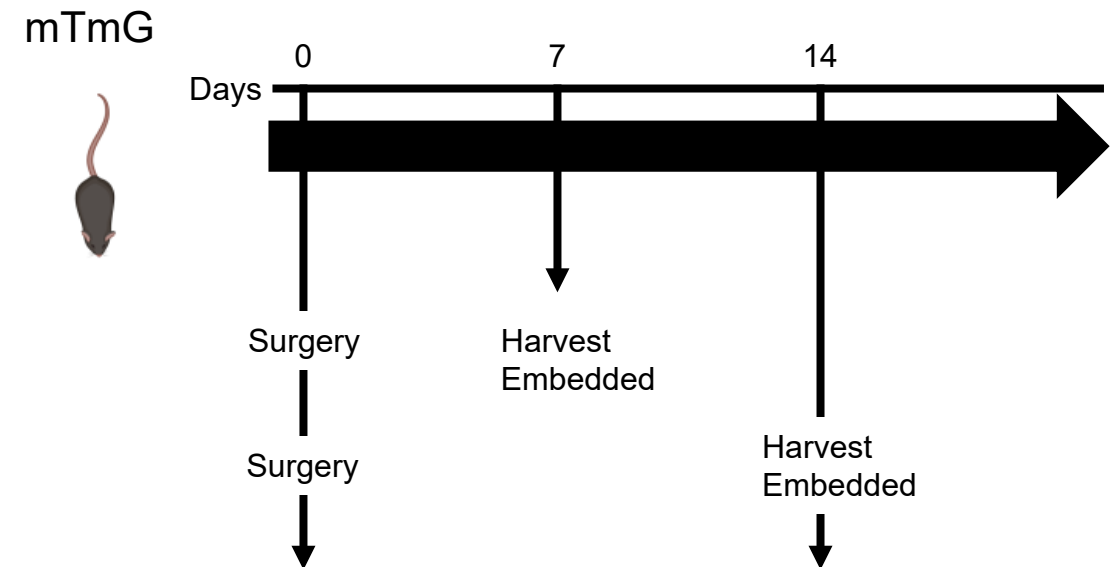

Aim: Does Na[ $^{18}\text{F}$ ]F **longitudinally trace** microcalcification formation in a model of AAA?  
Detect **cell type** contributing to microcalcification development in a model of AAA

## Molecular Imaging

- Complementary biodistribution study of Na[ $^{18}\text{F}$ ]F in abdominal aortic tissue
- Von kossa stain on abdominal aortic tissue

## Biological investigation

All cells = tomato

mGFP = vascular smooth muscle cells

CT angiography

Histology

PET/CT

Sham

PPE

Day 7

Sham

PPE

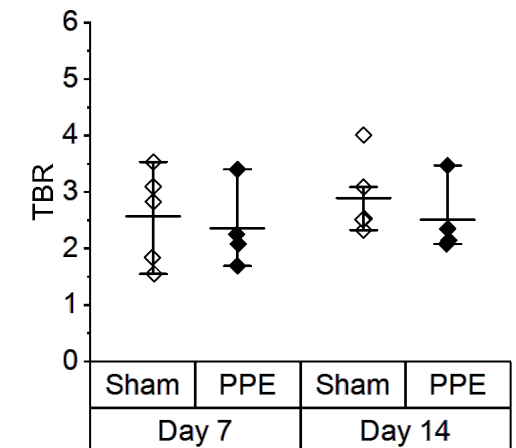

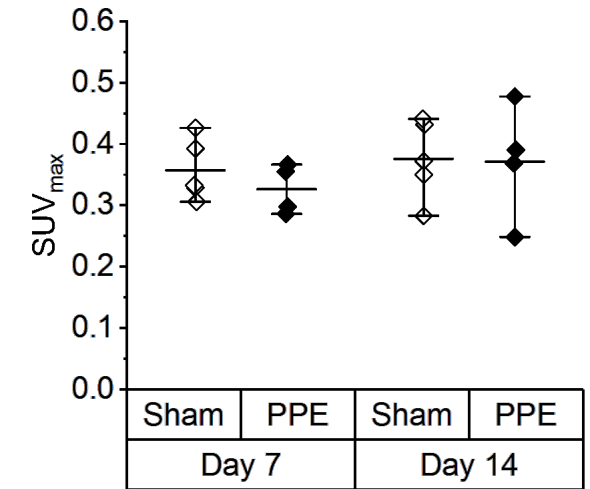

SUV<sub>max</sub> = 1.3

Day 14

SUV<sub>max</sub> = 0

## Biodistribution

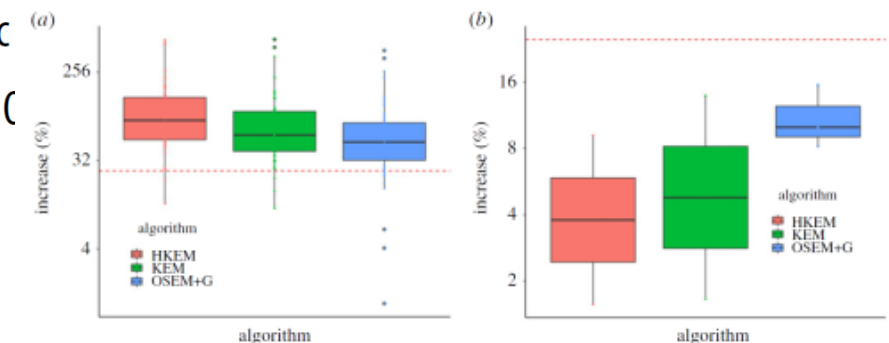

### Current work

## Improved identification of abdominal aortic aneurysm using the Kernelized Expectation Maximization algorithm

Kelley Ferreira<sup>1</sup>, Rachael C

**Figure 6.** Increase of uptake between the ROI T and A: (a) for the AAA patient data, (b) for the control group. The dashed line represents the 25% increase that defines AAA positivity. (Online version in colour.)

**Biodistribution studies** indicated an **increase** in  $\text{Na}[^{18}\text{F}]\text{F}$  uptake **day 14 post surgery** in PPE model. Difficult to detect using PET/CT

**Von kossa staining** detected **microcalcification** in PPE aortic tissue

Increase in BMP2 expression seen in VSMCs day 7 post surgery

**Therapeutic studies** in the PPE model to study  $[^{18}\text{F}]\text{NaF}$  **signal attenuation** to **prevent VSMC driven remodelling** of the aortic wall and microcalcification formation.

**Autoradiography** studies warranted to confirm  $\text{Na}[^{18}\text{F}]\text{F}$  **uptake** in PPE aortic tissue
